

JOMA PORTFOLIO REBRAND

AI Automation & Systems Builder

Joma Portfolio Rebrand — AI Automation & Systems Builder

Rebrand Objective

Reposition the portfolio from a broad Web, Design & Automation identity into a clearer current identity: **AI Automation & Systems Builder**.

The portfolio should communicate that Joma can translate a business problem into a working digital system using AI, automation, APIs, data, UX, frontend development, debugging, validation, and documentation.

The existing web/design and IT background remains visible as a differentiator, but supports the current systems-builder identity.

New Positioning

Primary title: AI Automation & Systems Builder

Supporting statement: I design and build practical digital systems that connect AI, APIs, workflows, data, and people — from business requirements and architecture through implementation, debugging, validation, and documentation.

Personal methodology: BE EXCITED. BUILD. BREAK THINGS. DEBUG. LEARN.

Homepage Structure

Hero

AI Automation & Systems Builder

I turn business problems into working digital systems.

I combine AI, workflow automation, APIs, data, UX, and hands-on engineering to design, build, test, and document practical systems.

CTA: Explore Automation Lab / View Selected Projects

Homepage Story

My background began in web design and IT. After a long break from hands-on technology work, I returned by rebuilding my skills through practical projects in AI, automation, web development, and systems integration.

I learn by building: start with an idea, make it work, break it, debug it, understand why it failed, and build the next version better.

Three Capability Pillars

01 — AI Automation

AI workflows, APIs, webhooks, RAG, AI agents, MCP, integrations, business process automation.

02 — Systems & Product Development

Architecture, frontend, databases, APIs, business logic, UX, validation, debugging, documentation.

03 — Design & IT Foundation

Web design, UI/UX, HTML/CSS, WordPress, Shopify, branding, multimedia, IT support, networking, SQL.

Featured Projects

01 — AI Agent Conference

Position as the strongest systems project. Emphasize agent specialization, orchestration, MCP, human-in-the-loop, verification, local-first architecture, persistent memory, and browser interface.

02 — AI Workflow Generator

Position as AI automation / meta-automation. Explain the key lesson: valid workflow JSON is not automatically a correct business automation.

03 — BoholPlay

Position as Product / UX / Web Application. Demonstrate business problem → product → UX → implementation.

04 — Automation Lab

Make this a living section documenting small experiments and what each one teaches.

Automation Lab

Build. Break. Debug. Learn.

Suggested progression:

1. Webhook → Google Sheets
2. Webhook → API → Response
3. Webhook → AI → Structured JSON
4. AI Lead Qualification
5. AI Customer Support Router
6. Invoice Processing
7. RAG Knowledge Base
8. Executive AI Briefing
9. AI Agent Systems
10. AI Automation Generator

The objective is not to make every project huge. The objective is to demonstrate increasing understanding.

Project Documentation Template

For every technical project:

1. Business problem
2. Goal / acceptance criteria
3. Workflow diagram
4. Input JSON
5. Node-by-node data flow
6. Credentials / authentication

7. API details
8. Transformations
9. Expected output
10. Deliberate failure tests
11. Actual errors
12. Root cause
13. Fix and why it works
14. Final workflow
15. Lessons learned
16. Next version

Portfolio Navigation

Home / Automation Lab / Projects / Systems & Skills / Design Archive / About / Contact

Design Archive

Keep the older web work and label it clearly as **Design Archive · Earlier Career**. It documents the design and production foundation that continues to influence the modern systems work.

Video / Motion Portfolio

Keep the video work. Position it as **Motion & Visual Systems** or **Video & Multimedia Archive**. It demonstrates the creative side of the same person who now builds technical systems.

About

Suggested theme: **A designer who learned to think like a systems builder.**

Explain the progression honestly:

Web and visual design foundation → IT and systems experience → long break → return through practical experimentation → AI-assisted development → automation → agents → systems integration.

Avoid positioning primarily as an “AI Prompt Specialist.” Prompting is a skill used inside the larger systems-building capability.

Visual Direction

Technical but human. Clean typography. Strong workflow diagrams. Code/data details. Subtle motion. Interactive project demonstrations. Before/after debugging stories.

Avoid the generic “AI consultant” look. The personality should communicate: **Builder + Designer + Experimenter**.

Rebrand Success Criteria

A visitor should understand within 10 seconds:

1. Joma builds AI-powered automations and digital systems.
2. Joma understands APIs, workflows, data, UX, and implementation.
3. Joma learns by building and debugging real experiments.
4. Joma has a design/IT foundation that makes the profile multidisciplinary.
5. The work is practical and hands-on.

Implementation Order

Phase 1 — Positioning

Change title, hero, introduction, and establish AI Automation as the primary identity.

Phase 2 — Project hierarchy

Feature AI Agent Conference, AI Workflow Generator, BoholPlay, and Automation Lab.

Phase 3 — Case studies

Apply the project documentation template.

Phase 4 — Archive

Move older web design and motion work into clearly labeled archive sections.

Phase 5 — Visual refinement

Update typography, diagrams, project cards, animations, and visual identity.

Phase 6 — Continuous updates

Every new automation experiment becomes another documented case study.

Final Positioning

The website should no longer say: “Here are all the things I know.”

It should say:

“Here is how I think, build, debug, and turn ideas into working systems.”
